SUMMARY

Software engineer with 1.5+ years shipping production systems at an AI startup: queue pipelines, LLM evals, billing ledgers and Kubernetes infrastructure on AWS and GCP, end to end in TypeScript, Node.js, Next.js, PostgreSQL, ClickHouse and Terraform.

EXPERIENCE

Software Engineer — Feb 2025 - Present

MagicAPI (Noveum.ai, API.market) — *Remote, San Francisco, CA, USA*

- Re-architected LLM trace ingestion into an **async BullMQ/Redis queue** (up to **10,000-trace batches**) on Kubernetes.
- Expanded the worker fleet to **10+ Docker deployments** (ETL, evals, analytics, billing), then root-caused an **8.5-hour eval stall** to KEDA ignoring BullMQ prioritized queues and replaced it with fixed-replica hot, LLM (Spot) and cron pools on GKE.
- Built the **LLM evaluation pipeline end-to-end**: an ETL service turning production AI-agent traces into datasets by running customers' Python transform code in a sandbox, shipping batch and realtime eval jobs behind **15+ REST endpoints**.
- Led the **AWS migration from OVHCloud** (EKS clusters, ECR, S3, CodeBuild CI/CD, WAF, IAM within a VPC), then the move from **AWS EKS to Google Cloud (GCP)** as Infrastructure as Code (IaC): **6 OpenTofu (Terraform) modules**, 2 Helm charts and Cloud Deploy CI/CD on private GKE; fixed **5 launch-blocking defects**; proved Cloud SQL restore in **6m17s**.
- Optimized analytics performance: moved **20+ dashboard endpoints** from live ClickHouse to precomputed PostgreSQL snapshots, cut peak rollup query memory for a heavy tenant from **4.01 to 1.75 GiB** via 90-day chunking, and removed **21% duplicate spans**.
- Rebuilt usage billing as a **PostgreSQL credit ledger** that reserves credits before paid work and settles after (per-org locks, idempotency keys), so concurrent jobs cannot overspend or double-charge; added **AWS Marketplace billing** (SQS, EventBridge).
- Launched the **public TypeScript API** used by the tracing SDK (100+ tests), moved 10+ Next.js route handlers into one Node.js/Hono API with Redis rate limiting, and built a **Model Context Protocol (MCP) server** exposing **220+ OpenAPI routes** as tools.
- Architected and led the initial build of Orbit, an open-source realtime issue tracker (**60+ GitHub stars**) replacing Linear in-house: a **60+ table PostgreSQL schema**, a filter engine compiled to SQL, and sync of 20+ data types via Redis pub/sub and Bun WebSockets.
- Built the prepaid wallet for API.market, an API marketplace, in Next.js, Prisma and Stripe (**$50K+ in transactions**, 23K+ operations, 1.1K+ users) and a voucher system distributing **$6.3K+** via targeted (email-specific) and public (limit-based) campaigns.

Software Engineer — Feb 2025 - Mar 2025

CrowdVolt (YC W24) — *Remote, NYC*

- Set up shared **ESLint and Prettier** configs to enforce coding standards across a Turborepo monorepo (web, mobile, 7 packages).
- Improved site performance using **lazy loading, code splitting and asset optimization** for faster load times.
- Fixed **critical bugs** affecting user experience and platform stability.

Full Stack Engineer Intern — Apr 2024 - Sep 2024

Datawavelabs — *Remote, India*

- Built the FastAPI backend (**35+ REST endpoints**) of a multi-cloud platform so users could manage AWS, Azure and GCP resources from one dashboard, with live credential checks, JWT sessions, Google OAuth and role-based access control (RBAC).
- Automated **AWS EKS cluster create and teardown** from the API by launching Terraform runner containers in Docker, streaming live status to the React UI over Redis Pub/Sub and Server-Sent Events (SSE).

PROJECTS

Devolympus Hackathon Platform | *Next.js, PostgreSQL, Prisma, Cloudinary, OAuth 2.0* — **Apr 2025**

- Built a **hackathon management system** handling **350+ registrations** and **80+ teams**, cutting admin work by **80%**.
- Added Google OAuth login and built team registration, payment management, and document uploads to Cloudinary.
- Created an **admin dashboard** with role-based access and a PostgreSQL/Prisma backend for managing applications, teams, and payments.

Deployit | *Next.js, Docker, Redis, S3, Express* — **Oct 2024**

- Built a **deployment platform** where users deploy repos via custom slug URLs with automated build pipelines.
- Used **Redis for deployment queues**, isolated **Docker build containers**, and S3 for serving static assets.
- Set up an **Express reverse proxy** to route traffic to deployed sites based on custom slugs.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, C++, SQL, HTML, CSS, Bash, HCL, YAML | **CS Fundamentals**: DSA, Distributed Systems
Frontend: Next.js, React, Redux, Tailwind CSS, Shadcn/ui | **Backend**: Node.js, Express.js, Bun, Hono, FastAPI, BullMQ
APIs and Data: REST APIs, GraphQL, WebSockets, SSE, PostgreSQL, ClickHouse, MongoDB, Redis, Elasticsearch, Prisma, Stripe
Cloud: AWS (EKS, EC2, S3, ECR, CodeBuild, WAF, SQS, Bedrock), GCP (GKE, Cloud SQL), Azure | **AI**: LLM evaluation, MCP
DevOps and Tools: Kubernetes, Docker, Helm, Terraform, OpenTofu, GitHub Actions, CI/CD, Git, JWT, OAuth 2.0

EDUCATION

B.Tech in Computer Science, Dronacharya College of Engineering, Gurugram, Haryana, India — **2022 - 2026**

LEADERSHIP & ACHIEVEMENTS

- **OpenAI Codex Hackathon**: Secured 7th position for Warden, a trust layer for packages and agent diffs before they run.
- **KRMU Hackathon**: Won 1st place in the AI track with WanderAI.
- **Chairperson, Deviators Coding Club (2024 - 2025)**: Founded and led an independent college coding club. Organized workshops, tech events, and DevOlympus, a hackathon with 350+ participants.
- **ICPC Amritapuri 2023 Regionalist**: Qualified for the regional round of the global programming competition.
- **Gurugram University Ideathon Winner**: Secured first place for AI-driven travel solutions, awarded by the Chief Minister of Haryana.
